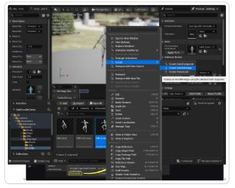
Dylan

Montages

A Montage can play an Animation Clip, or several clips, as well as triggering Notifies.

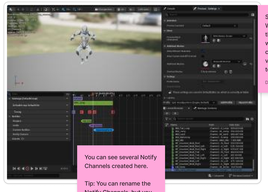
The Notifies can handle the particle systems and sfx as well as Custom Notifies that can be created to do virtually anything.

Dylan



Simplest way to create a Montage is from the Animation itself.

Dylan

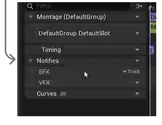


You can see several Notify Channels created here.

Tip: You can rename the Notify Channels, but you have to click directly on the name itself.

(Thanks John for the clarification).

Dylan



Settings in the Preview Window allow you to set the preview mesh. This won't be permanent but can be useful for visualizing things to set it to the expected mesh.

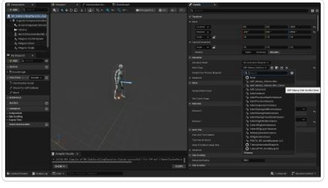
Dylan

Attaching Montages

Settings up the Montages

- You'll have to add a Slot to the Animation BP

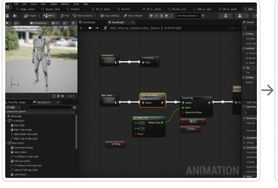
Dylan



Settings up the Montages

- I'll use the Default slot for now.

Dylan



Settings up the Montages

- If you change the Slot name you'll have to update this.
- For now, you can use the basic slot.

Dylan

Playing the Montages from Blueprints.

Dylan

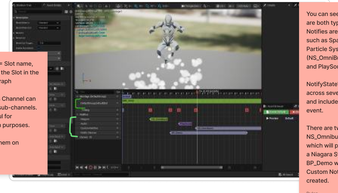
Notifies

Basic Notify

Basic Notifies exist for common things like Spawning Niagara Particles or playing SFX

Dylan



DefaultSlot = Slot name, must match the Slot in the AnimationGraph

The Notifies Channel can have many sub-channels. This is useful for organization purposes.

Tip: Name them on creation.

Dylan

You can see here, there are both types of Notifies. Notifies are single events such as Spawn Niagara Particle System (NS_OmniBurst in Green) and PlaySound

NotifyState's persist across several frames, and include an OnTick event.

There are two here: NS_Omniburst (in grey) which will play and disable a Niagara System and BP_Demo which is a Custom Notify State that I created.

Dylan

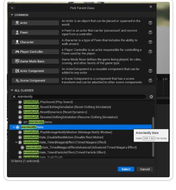
Custom Notify State

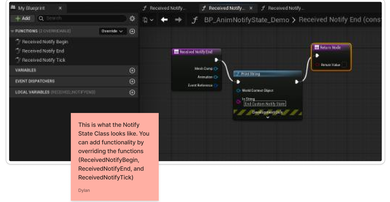
Custom Notify Classes can be created as a Blueprint by selected the AnimNotify as a parent class.

Note the difference between Animation Notify and Animation Notify State.

The State includes a range of time values and is useful for turning something both on and off.

Dylan





This is what the Notify State Class looks like. You can add functionality by overriding the functions (ReceivedNotifyBegin, RecevedNotifyEnd, and RecevedNotifyTick)
