

AM3 – Assignment 4: “Game Feel” Capstone Project

Grading Summary:

Category	What is Evaluated
Input – Responsiveness & Controls	How responsive the controls are, supported input schemes, and improvements based on playtesting.
Movement – Physics & Motion	Smoothness, satisfaction, and realism of movement; tuned physics and interactions with the environment.
FX & Visual Responsiveness – Pawn & UI	How well visuals respond to input and movement, including particle effects, animations, or UI feedback.
Testing & Iteration Notes	Evidence of playtesting, recorded observations, and iterative improvements made to the project.
Design Documentation – Summary Document	Clarity, completeness, and structure of the 1-page summary, including improvements and rationale.
Rules/Controls Page	Clarity and usability of controls or rules; support for playtesting.
Presentation & Polish – Demo Playability	Overall playability, smoothness, visual/audio polish, and demonstration of improved game feel.
Application of Math Skills	Correct and effective application of math concepts to input, movement, and FX systems; demonstrated understanding.

Self-Evaluation Rubric

Use this rubric to assess your own work before submitting. Score each criterion from 1–4 based on your project.

Criterion	4 – Excellent	3 – Good	2 – Satisfactory	1 – Needs Improvement	Your Score
Input – Responsiveness & Controls	Input feels tight and responsive; multiple supported control schemes tested; refined based on playtesting	Input mostly responsive; minor control issues; some testing/iteration	Input somewhat responsive; limited control schemes; minimal testing	Input unresponsive or controls confusing; no testing evidence	
Movement – Physics & Motion	Movement feels smooth, natural, and satisfying; physics tuned or exaggerated appropriately; environment interactions realistic	Movement mostly smooth; minor physics or motion issues	Movement somewhat rough; physics inconsistent	Movement feels off; physics poorly tuned or unrealistic	
FX & Visual Responsiveness – Pawn & UI	Visuals respond clearly to input and movement; includes effects/animations that enhance game feel	Mostly responsive visuals; minor inconsistencies	Some visual response; limited effects/animation	Visuals do not respond; no meaningful effects	
Testing & Iteration Notes	Clear record of playtesting; changes justified based on observations; iterative improvements documented	Some playtesting; partial record of changes	Minimal playtesting; limited notes	No playtesting or iteration evidence	

Criterion	4 – Excellent	3 – Good	2 – Satisfactory	1 – Needs Improvement	Your Score
Design Documentation – Summary Document	Clear, concise, polished 1-page summary; includes Game Overview, Design Improvements, Testing Notes, and Rules; well-structured	Mostly clear summary; minor missing sections	Partially clear; some sections missing or unclear	Incomplete, poorly structured, missing sections	
Rules/Controls Page	Controls clear, complete, and easy to use; supports testing	Mostly clear; minor omissions	Partially clear; some controls missing	Controls unclear or incomplete	
Presentation & Polish – Demo Playability	Demo fully playable, smooth, visually and audibly coherent; reflects game feel improvements	Mostly playable; minor issues in smoothness or visuals	Playable but rough; noticeable issues	Not playable or missing polish	
Application of Math Skills	Math applied correctly and effectively to input, movement, and FX systems; clearly demonstrated understanding	Mostly correct; minor errors or incomplete application	Some correct application; partial understanding	Incorrect or no evidence of applying math concepts	

Instructions for Self-Grading:

1. Score each criterion honestly from 1–4.
2. Maximum total score = 32 points.
3. Multiply your total by 3.125 to convert to a percentage out of 100.
4. Use this reflection to check that your submission clearly communicates your contributions and demonstrates improved game feel and math application.
5. 5. Instructor reserves the right to overrule your self-graded marks if deemed appropriate.
