

# Game Design & Accessibility

## Chosen game: Haste

### Game Feel:

- "The Juice":
  - Feeling fast
    - Subtle speed lines around the edge of the screen
    - Motion blur
    - running trail of mud/snow depending on what you are running on
      - Looks like the ground is upset from the sheer speed you are travelling
    - Focus shield like effect for diving down quickly to showcase the wind resistance
  - Getting a perfect landing
    - Very nice sound that plays
    - Extra speed lines and motion blur on landing
    - Big bold font in yellow letters that shows up and says *Perfect*
    - If you jump again shortly after your character will do a cool trick in the air
  - Sense of progression
    - "sparks" which act as currency to buy items
      - Items vary in impact on gameplay, from things that completely change how you play to just minor positive buffs
    - Meta Sparks that let you get small upgrades between runs

### Accessibility:

- Things done well:

- Just due to the game being a speed runner, it plays well for someone deaf
- There are plenty of options that don't affect ability to unlock achievements or progression that allow you to tune gameplay difficulty, like collapse speed, damage taken by the player, ect
- Areas that need improvement & how I would rectify them:
  - No settings to change how color is rendered for colorblind people
    - I looked online and there is a [color blindness asset package](#) that handles this for you, so I would implement that
  - The game doesn't rely on sound for much except adding to immersion so someone who is deaf could play, but would still benefit from added subtitles.
    - Create subtitles for impactful auditory events, such as perfect landings, to allow someone who is deaf to be able to understand the feeling it's trying to convey.
